

top five reasons

why Wright Line enclosures are the leader in today's data centers

Scalable Design 1

Wright Line's enclosure systems are the most flexible platforms available. Featuring a unique building-block design they can easily be reconfigured – keeping pace with your changing needs. And, given that the technology refresh rate for IT (server and networking) equipment is typically 12-18 months, this underscores the importance of choosing an open and scalable enclosure platform. Available in a variety of heights, depths and widths, Wright Line's fully welded enclosures also offer a wide array of accessories to meet the specific storage requirements of virtually all IT equipment. At Wright Line, we work to future-proof your data center with enclosures configured your way!

Heat Containment 2

It is said that 40% of the cool air that is supplied from air conditioning units in a typical data center is wasted. With Wright Line's enclosures and chimney system, you can achieve closed coupled heat containment of 15kW and greater. Our heat containment solutions ensure that hot air created by your IT equipment is channeled from the enclosures through the chimney and returned to the data center's air conditioning units. This virtually eliminates air remixing and stratification.

Power Distribution 3

Wright Line provides the widest variety of power and power management capabilities through its basic, metered and managed power distribution offering. What was once a simple task of mounting 15 – 20 Amp power strips has evolved into a calculated strategy to manage power-intensive servers in densely-packed enclosures. Our three-phase power strips can deliver up to 17.2kW of power in one cable, rather than running multiple single-phase cables. And, with Wright Line's 80kW In-row Power Enclosures and top name uninterruptible power supplies, you can rest assured that you will achieve maximum uptime.

Cable Management 4

At Wright Line, we take a unique approach by addressing cable and access management concurrently. From a structural standpoint, our frame designs efficiently accommodate large quantities of cables and provide unmatched enclosure-to-enclosure, raised floor and overhead cable access. This approach is not only crucial to safeguarding cabling, but it is required to maximize airflow and provide clear, easy access to equipment.

Custom Collaboration and Engineering 5

Our philosophy is to treat every customer installation in a consultative manner where we listen to your unique needs and develop a solution to fit your requirements. That's how we have earned life-long customers who demand direct collaboration to create exact solutions for their real and emerging business problems and opportunities – solutions that ensure uptime and, in turn, their overall business success.
